

International Congress on Biological, Physical And Chemical Studies

International Congress on Biological, Physical And Chemical Studies - is an international conference platform under open access policy. The conference is led by international expert members who take an objective approach to peer review, ensuring each research paper is reviewed, edited by authors and evaluated on its own scholarly merits and research integration. Publishing and joining on the proceeding of the International Congress on Biological, Physical And Chemical Studies will ensure publishing experience and indexing possibilities on various global indexing.

Communication during Dental Treatment with Patients with Mental Disorders

Astanov Otabek Mirzhonovich

Bukhara State Medical Institute named after of Abu Ali ibn Sina

Relevance. The use of questionnaires aimed at identifying psycho-emotional disorders at a dental appointment can alarm or even offend the patient. After all, prejudiced attitudes towards people with mental illnesses, the so-called stigma, are widely known. Such people are treated with prejudice and a desire to avoid communicating with them. Many dentists do not want to treat patients with mental illness, citing the discrepancy between time and labor costs and the income received from the treatment provided. Also, many dentists are reluctant to accept patients with mental disorders due to a lack of knowledge on this problem and because of the unpleasant feeling of inadequacy of the patients.

The patient's feeling of discrimination towards himself will not contribute to establishing contact with the doctor, which is quite important in developing the patient's willingness to cooperate and follow the recommendations issued by the doctor. After all, the success of dental treatment largely depends on the careful and methodical implementation of the recommendations received. Compliance with recommendations depends on patient motivation for treatment and patient fatigue from treatment. In patients with mental disorders, fatigue and weakening of motivation occur faster or are initially at a low level.

Therefore, a rather important factor is the dentist's ability to establish contact with the patient, which, of course, depends on the level of his communication skills. Establishing a trusting relationship between the patient and the doctor can become the basis on which the entire treatment process and the patient's willingness to cooperate for many years will be built. Indeed, during the treatment process, a more trusting type of relationship is formed, when the interaction of both parties and their ability to partner in the treatment process is important.

Conclusion. Assessing the personal characteristics of patients with mental illness allows for effective preparation of patients for a dental examination, which will contribute to effective treatment. Conducting psychological screening in mentally ill patients contributes to a favorable treatment process at the dentist. The results of clinical observations and research allow us to develop an effective approach to the early diagnosis of dental diseases in patients with mental pathology.
